This section presents the proposed features of the Auto Ticket Classification using Flow Designer project. The workflow is designed to automatically process incoming support tickets, identify the relevant category, assign the ticket to the appropriate group, and update the ticket record with minimal manual intervention.

S.No	Feature Name	Description	Status	Demonstrated	Remarks
1	Ticket Trigger	Automatically triggers the Flow Designer workflow when a new support ticket is created.	Implemented	Yes	Starts classification without manual execution.
2	Ticket Data Extraction	Reads important ticket information such as short description, description, priority and related fields.	Implemented	Yes	Required data is collected from the ticket record.
3	Automatic Classification	Classifies tickets into predefined categories based on the ticket information and configured conditions.	Implemented	Yes	Reduces manual classification effort.
4	Assignment Group Routing	Routes the classified ticket to the appropriate support or assignment group.	Implemented	Yes	Improves routing consistency and response workflow.
5	Ticket Update	Automatically updates the ticket category, assignment details and relevant workflow fields.	Implemented	Yes	Keeps the ticket record synchronized with the classification result.
6	Flow Execution and Validation	Validates the workflow execution and confirms that the ticket moves through the expected classification and routing steps.	Implemented	Yes	Supports demonstration and verification of the complete flow.

Feature Implementation Summary

Demonstration Outcome

The proposed workflow demonstrates an end-to-end approach for automatic ticket classification using Flow Designer. A newly created ticket acts as the starting point, relevant ticket information is processed, the ticket is classified according to configured rules, and the resulting category and assignment information are updated automatically. The demonstration focuses on reducing repetitive manual work and improving consistency in ticket routing.

Note

The uploaded reference document provides the demonstration-feature template and summary fields; the feature descriptions above are tailored to the requested project topic rather than copied from the reference document.
