

AUTO TICKET CLASSIFICATION

Using Flow Designer

Project Demo Presentation

1. Introduction & Problem Statement

Support teams receive many tickets every day. Manual classification takes time and may cause incorrect routing. Tickets need to be categorized and assigned quickly.

2. Solution Overview

Flow Designer automates ticket classification. A trigger starts the flow when a ticket is created or updated. The flow checks ticket information, identifies the category, and routes the ticket to the appropriate team or assignment group.

3. Automation Flow

Step	Process
1	Ticket Created / Updated
2	Flow Designer Trigger
3	Read Ticket Details
4	Apply Classification Rules
5	Set Category / Priority / Assignment
6	Update & Route Ticket

4. Live Feature Demonstration

Step 1: Create a sample support ticket.

Step 2: Enter the issue description.

Step 3: Flow Designer is triggered automatically.

Step 4: Classification logic identifies the ticket type.

Step 5: Category and assignment are updated automatically.

Step 6: Verify the final ticket details.

5. Expected Result

- Reduced manual effort
- Faster ticket routing
- Consistent classification
- Better visibility of ticket categories
- Improved support workflow efficiency

6. Q&A; Session
