

Auto Ticket Classification using Flow Designer

Date	29 September 2026
Team ID	SWTID-2026-1551
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	5 Marks

Auto Ticket Classification using Flow Designer:

S.No	Component / Module Name	Language / Technology	Where Reused	Reusability Level (High / Medium / Low)
1	Ticket Classification Flow	ServiceNow Flow Designer	Incident / ticket classification	
2	Decision / Condition Logic	Flow Designer	Category and routing rules	
3	Flow Actions	ServiceNow Actions	Ticket field updates / assignment	

4	Subflow	Flow Designer	Reusable classification or routing logic	
5	Notification / Assignment Step	ServiceNow	Team notification and routing	

This document evaluates the design and implementation of an automated ticket classification solution using ServiceNow Flow Designer. The solution is intended to automatically classify incoming tickets based on defined conditions such as ticket category, short description, keywords, or other relevant fields, and then route or update the ticket accordingly. A well-structured flow improves consistency, reduces manual classification effort, and supports maintainable automation.

Flow Designer Checklist:

S.No	Quality / Automation Parameter	Description	Followed (Yes / No / Partial)	Remarks
1	Trigger Configuration	Flow starts from the appropriate ticket creation/update trigger.		
2	Input / Data Handling	Required ticket fields are correctly available to the flow.		
3	Classification Conditions	Conditions identify ticket type/category using defined rules.		
4	Decision Logic	If/Else or decision logic routes tickets to the correct classification.		
5	Field Updates	Classification fields such as category/subcategory are updated correctly.		
6	Assignment / Routing	Tickets can be routed to the appropriate group or process.		
7	Reusable Flow Logic	Actions/subflows are organized for reuse where applicable.		
8	Error Handling	Flow handles missing data, unmatched conditions, or failures gracefully.		

Reusable Components / Modules:

Overall Flow Quality Assessment:

Aspect	Rating (1-5)	Comments
Flow Design & Structure		Flow steps and logic are organized clearly.
Readability		Conditions, actions, and names are easy to understand.

Reusability		Common classification logic can be reused through actions/subflows.
Documentation / Comments		Flow purpose, conditions, and important steps are documented.
Automation Effectiveness		Classification reduces manual ticket handling and supports cons routing.
Overall Score		

Project Summary

The Auto Ticket Classification using Flow Designer project automates the initial classification of service tickets. Based on configured conditions, the flow evaluates ticket information, determines the appropriate classification, updates relevant fields, and can route the ticket to the required team. The approach is designed to improve consistency, reduce repetitive manual work, and provide a reusable automation structure.
