

Auto Ticket Classification using Flow Designer

1. PROJECT OVERVIEW

Problem:

Manual ticket classification can be time-consuming and inconsistent.

Solution:

Use Flow Designer to automatically classify incoming tickets
and route them to the appropriate category / assignment group.

2. CORE WORKFLOW

1. Ticket is created or updated
2. Flow Designer trigger starts the workflow
3. Ticket details are evaluated
4. Classification rules identify the category
5. Assignment group / priority is updated
6. Ticket moves to the next stage automatically

3. KEY FEATURES IMPLEMENTED

- Automatic ticket classification
- Rule-based decision logic
- Automatic assignment / routing
- Reduced manual intervention
- Consistent categorization
- Workflow-based processing

4. FLOW DESIGNER COMPONENTS

Trigger:

Start when a new ticket is created.

Actions:

Read ticket fields → evaluate conditions → set category
→ assign the ticket → update workflow status.

5. SOLUTION SUMMARY

Repository Link / URL: Add your GitHub / GitLab link

Programming / Platform: ServiceNow Flow Designer

Framework / Technology: Flow Designer, Flow Logic, Actions

Key Feature: Automatic ticket classification and routing

Pending: Add any project-specific integrations if applicable

6. SETUP / RUN INSTRUCTIONS

1. Open the ServiceNow instance
2. Create / configure the required ticket fields
3. Open Flow Designer
4. Create the ticket trigger
5. Add classification conditions and actions
6. Activate the flow
7. Create test tickets and verify classification

7. CODE / SOLUTION QUALITY CHECKLIST

- ✓ Flow is modular and organized
- ✓ Meaningful names are used for flows and actions
- ✓ Logic is documented where necessary
- ✓ Error / exception paths are considered
- ✓ Workflow runs without critical errors
- ✓ Changes can be tracked through version control / repository

8. EXPECTED RESULT

Input: New support ticket

Category + Assignment + Priority

↓

Automatically routed ticket

9. CONCLUSION

Auto Ticket Classification using Flow Designer

provides a structured workflow for handling incoming tickets.

It improves consistency, reduces repetitive manual work,
and helps route tickets to the appropriate team automatically.
