

PROJECT EXECUTABLE FILES

Project Name: Auto Ticket Classification using Flow Designer

Date: 29 September 2026

Team ID: SWTID-2026-1551

Maximum Marks: 3 Marks

This section provides the executable, deployable and supporting files required for the Auto Ticket Classification using Flow Designer project.

The solution is designed to automatically classify incoming support tickets based on ticket information such as category, description, priority and related conditions, and then route or update the ticket through an automated Flow Designer workflow.

Step 1: Submission Checklist

S.No	Item to Submit	Status
1	Complete Flow Designer workflow / source configuration	Yes / NA
2	README / Setup Guide with configuration steps	Yes
3	Required application, plugin or dependency details	Yes / NA
4	Ticket fields, categories and classification rules	Yes
5	Environment configuration / sample configuration	Yes / NA
6	Deployed application / instance URL, if hosted	Yes / NA
7	Executable application or package, if applicable	Yes / NA
8	Flow Designer configuration / exported flow, if supported	Yes
9	Test cases and test results	Yes
10	Demo video / walkthrough, if required	Yes / NA

Step 2: File / Folder Structure

A suggested project structure for the Auto Ticket Classification using Flow Designer project is:

Component	Purpose
README.md	Project overview, setup and execution instructions
Flow Designer Flow	Main automation that receives and classifies support tickets
Classification Rules	Conditions used to identify ticket category / type
Ticket Configuration	Ticket fields, categories, assignment and priority configuration

Test Cases	Sample tickets and expected classification results
Test Results	Evidence of successful workflow execution
Demo / Screenshots	Flow Designer and classification execution evidence

Step 3: Deployment / Access Details

Hosted / Deployed URL: _____

Login Credentials (Demo): _____

Platform / Hosting Provider: ServiceNow / Flow Designer environment

Repository Link: _____

Demo Video Link: _____

The project should be deployed or demonstrated in the configured Flow Designer environment. Access details should be supplied only for the evaluator/demo environment.

Step 4: Run Instructions

1. Open the configured Flow Designer environment and verify that the required ticket table, fields and classification values are available.
2. Open the Auto Ticket Classification flow and confirm that the trigger is configured for a new or updated support ticket.
3. Verify the classification conditions, such as ticket description, category, keywords or other configured fields.
4. Activate the flow if it is not already active.
5. Create a sample support ticket with relevant issue details.
6. Allow the Flow Designer workflow to execute the classification logic.
7. Verify that the ticket category / classification and any configured assignment or priority fields are updated automatically.
8. Review the flow execution details to confirm successful completion.
9. Repeat the test with different ticket types to verify that the configured classification rules work as expected.

Step 5: Known Issues / Limitations

rules with ticket details	S.No	Known Issue / Limitation	Workaround / Status	Improve and test more examples. clearer ticket or add additional conditions.
	1	Classification accuracy depends on the configured rules and ticket information.		
	S.No	Known Issue / Limitation	Workaround / Status	
	2	Ambiguous or incomplete ticket descriptions may not map to the intended category.		
	3	Changes to ticket fields or Flow Designer configuration may require	flow updates.	

Review and test the flow after configuration changes.

Expected Result: When a support ticket is created or updated, the Flow Designer workflow automatically evaluates the configured conditions and classifies the ticket according to the defined rules, reducing manual classification and improving consistent ticket routing.

Note: Replace blank deployment, repository, login and demo-video fields with the actual project details before submission.
