

Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-1551
Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what your solution will do and how well it will perform.

- Functional Requirements (FR) define specific behaviors, functions, or features of the system (What the system should do).
- Non-Functional Requirements (NFR) specify the criteria that judge the operation of a system, rather than specific behaviors (How the system should be).

Fill out the descriptions and necessary details for each category provided below.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Authentication	Users access the ServiceNow application through authenticated accounts. Only authorized users can create or work with IT tickets.	High

2	Authorization levels	Role-based access controls determine who can create, view, update, assign, resolve, and close School IT tickets.	High
3	External interfaces	The Flow Designer automation uses ServiceNow tables and referenced user/group records to classify tickets and route them to the appropriate assignment group.	Medium
S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
4	Transactions processing	When a ticket is created or updated, the Flow Designer flow evaluates ticket data, applies the defined classification logic, and updates the relevant ticket fields automatically.	High
5	Reporting	The solution should support ServiceNow list views and reports that show ticket categories, assignment groups, states, and classification outcomes for monitoring and analysis.	Medium
6	Business rules, etc.	The flow should classify tickets using the configured business logic, such as category and subcategory values, and route tickets consistently without unnecessary manual intervention.	High

7	Compliance to laws or regulations	The solution should follow the organization's ServiceNow access-control and data-handling requirements and protect user and ticket information from unauthorized access.	Medium
8	Other	The ticket form should capture structured fields such as Number, Caller, Category, Subcategory, Short Description, Description, State, Assigned Group, and Assigned to.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	The automation should evaluate a newly created or updated ticket promptly and complete classification without unnecessary delay.	Classification completes within a few seconds under normal load.

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
-------------	---------------------	--------------------------------	--

2	Scalability	The flow should continue to process increasing numbers of IT tickets using the scalable ServiceNow platform and Flow Designer execution model.	Supports growth in daily ticket volume without redesigning the classification logic.
3	Security & Data Privacy	Ticket, caller, and assignment information should be protected through ServiceNow roles, permissions, and controlled access to records.	Only users with appropriate access can view or modify protected ticket data.
4	Reliability & Availability	The flow should execute consistently whenever its configured trigger conditions are met and should avoid unintended duplicate or conflicting updates.	Successful execution for valid trigger events with consistent field updates.
5	Usability & Accessibility	The ticket form and automated classification should be easy for support users to understand, with clear choices and predictable field behavior.	Users can create and process tickets using the defined fields and choices without additional manual classification steps.
6	Other	The solution should be maintainable so that categories, subcategories, routing rules, and flow actions can be updated as the support process changes.	Business rules and flow steps can be reviewed and modified without rebuilding the complete application.
