

PROBLEM–SOLUTION FIT CANVAS

Project: Auto Ticket Classification using Flow Designer

1. CUSTOMER SEGMENTS [CS]

- IT service desk agents
- Employees raising support tickets
- IT support / operations teams

2. PROBLEMS / PAINS + FREQUENCY [PR]

- Manual ticket categorization is repetitive — very frequent
- Wrong category/assignment causes delays — frequent
- Agents spend time reading and routing tickets — daily

3. TRIGGERS TO ACT [TR]

- Sudden increase in ticket volume
- Repeated misrouting or reassignment
- SLA/response-time issues

4. EMOTIONS BEFORE / AFTER [EM]

BEFORE: Frustration, workload pressure, uncertainty, repeated manual effort.

AFTER: Faster handling, confidence in routing, reduced workload, better visibility.

5. AVAILABLE SOLUTIONS — PROS & CONS [AS]

Manual classification: simple, but slow and inconsistent.

Rule-based routing: consistent, but requires many rules and maintenance.

Basic automation: reduces effort, but may not handle varied ticket

6. CUSTOMER LIMITATIONS [CL]

- Existing workflow/platform constraints
- Limited time for configuration
- Need for simple, maintainable automation

7. BEHAVIOR + ITS INTENSITY [BE]

- Agents read ticket subject/description and select category — high intensity
- Tickets are reassigned when incorrectly routed — medium/high
- Teams monitor queues and SLA status — daily

8. CHANNELS OF BEHAVIOR [CH]

ONLINE

- Service portal / ticketing application
- Email-to-ticket

9. PROBLEM ROOT / CAUSE [RC]

- Ticket information arrives as unstructured text
- Classification depends heavily on manual judgement
- Categories and assignment groups may be numerous

10. YOUR SOLUTION [SL]

AUTO TICKET CLASSIFICATION USING FLOW DESIGNER

A Flow Designer-based automation that reads incoming ticket details, identifies the appropriate category/subcategory or assignment group using predefined decision logic, and automatically routes the ticket to the correct team.

EXPECTED OUTCOME

- Reduced manual classification effort
- Faster ticket assignment
- Fewer routing errors
